

Status List Page Documentation

1. Page Overview

This document describes the Tradenix Status List page, including its purpose, navigation path, visible status codes, search controls, and expected end-user behavior. The documentation is based only on the supplied Status List screenshot.

2. Page Purpose

The Status List page provides a reference list of declaration status codes and their corresponding descriptions. It allows users to quickly identify the meaning of a status code used elsewhere in Tradenix and to filter the list by code or description.

3. Navigation

Expected navigation path: Dashboard → Status List

The Status List option is available in the left-side navigation menu directly below Dashboard in the supplied interface.

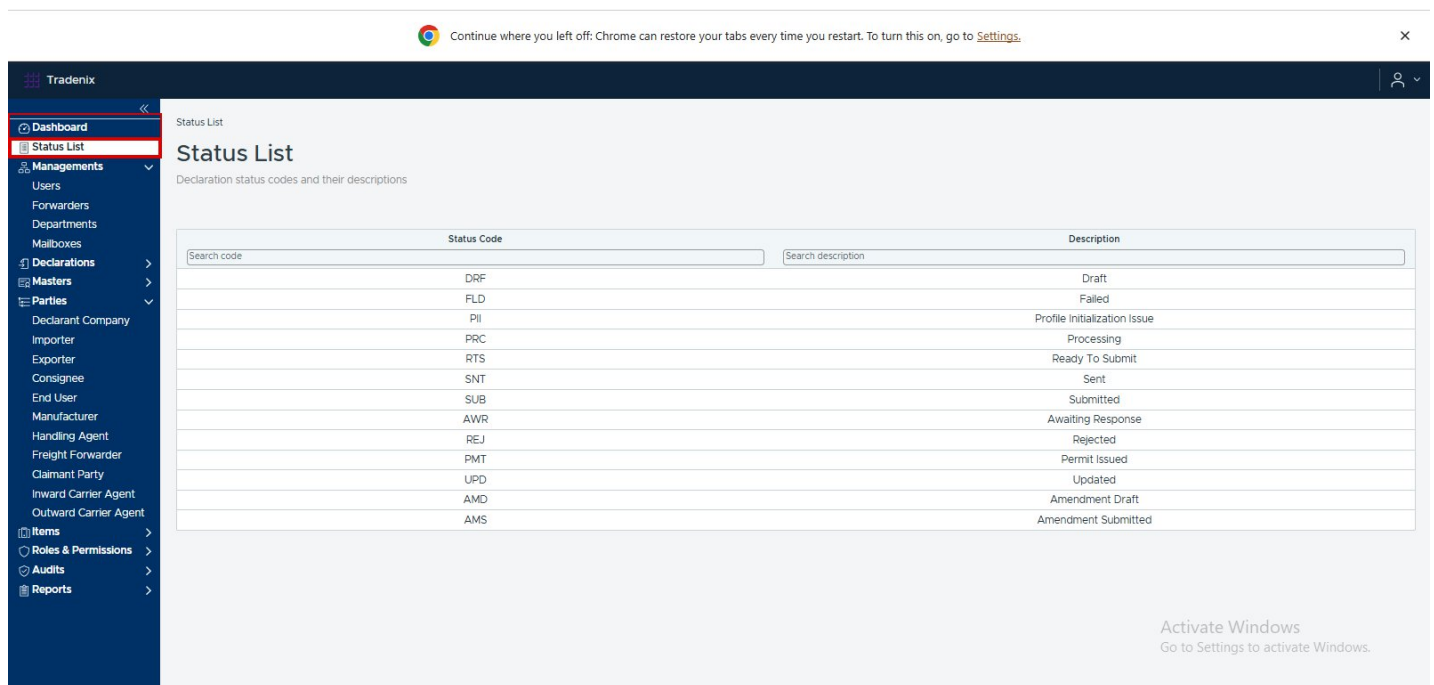

Figure 1. Navigate to Status List from the left-side menu.

4. Page Overview

The page contains a two-column reference table. The first column displays the Status Code and the second column displays its Description. A search field is available under each column header for filtering the visible list.

Page Element	Type	Purpose	Expected Behavior
Status Code	Table column	Displays the declaration status code.	Shows the short code used by Tradenix for a declaration status.
Description	Table column	Displays the meaning of the status code.	Shows the corresponding human-readable status description.
Search code	Text filter	Filter the list by status code.	Entering a value should narrow the visible rows to matching status codes.
Search description	Text filter	Filter the list by description.	Entering a value should narrow the visible rows to matching descriptions.

4.1 Search and Filter Controls

Two search inputs are visible at the top of the table. Use Search code when the status code is known, or Search description when searching by the status meaning.

5. Status Code Reference

The following status codes and descriptions are visible in the supplied Status List page screenshot:

Status Code	Description
DRF	Draft
FLD	Failed
PII	Profile Initialization Issue
PRC	Processing
RTS	Ready To Submit
SNT	Sent
SUB	Submitted
AWR	Awaiting Response
REJ	Rejected
PMT	Permit Issued
UPD	Updated
AMD	Amendment Draft
AMS	Amendment Submitted

6. Step-by-Step Procedure

Step 1 – Open the Status List page

From the Tradenix left navigation menu, select Status List. The system displays the Status List page containing the declaration status codes and descriptions.

Step 2 – Review the status reference

Review the Status Code and Description columns to identify the required declaration status and its meaning.

Step 3 – Search by status code

If the code is known, enter the required value in the Search code field. Use this field to narrow the list to the matching status code.

Step 4 – Search by description

If the status meaning is known instead of the code, enter text in the Search description field to locate the corresponding status.

Step 5 – Clear the search when finished

Remove the entered search text to return to the complete list of visible status codes.

7. Expected System Behavior

Scenario	Expected Behavior
Page opened	The Status List table is displayed with Status Code and Description columns.
Status code search entered	The visible list should be filtered to records matching the entered code.
Description search entered	The visible list should be filtered to records matching the entered description text.
No matching result	The page should show no matching rows or the application's standard empty-result behavior. Exact wording is not visible in the supplied screenshot and should be confirmed during QA.
Search field cleared	The complete available status list should be shown again.

8. Actions and Permissions

No Create, Edit, Delete, Activate/Deactivate, Save, or Cancel controls are visible on the supplied Status List page. Based on the screenshot, this page should be documented as a reference/list page with search capability only. Any additional administration behavior should be documented only after supporting UI or functional evidence is provided.

10. QA / Validation Notes

QA Area	Validation Check
Navigation	Verify Dashboard → Status List opens the correct page.
Data visibility	Verify every configured status code appears with the correct description.
Code search	Verify exact and partial status-code searches behave according to the implemented filter logic.
Description search	Verify description filtering returns the expected matching rows.
Clear search	Verify clearing a search restores the full list.
Read-only behavior	Confirm whether the Status List is intentionally read-only; no maintenance actions are visible in the provided screenshot.
Empty-result behavior	Confirm the message or visual state shown when no rows match a search.
